

Reference-mapping in single-cell genomics

Jaison Jain
Computational Biologist, Satija Lab

Reference mapping in genomics

Human Genome Project

- International collaborative effort (~10 years)
- Required high-quality data (~500 bp reads)
- Complex computational tools (“assemblers”)

Reference mapping in genomics

Human Genome Project

- International collaborative effort (~10 years)
- Required high-quality data (~500 bp reads)
- Complex computational tools (“assemblers”)

Can be leveraged to rapidly & reliably annotate new data

The screenshot shows the BLAST web interface. At the top, there's a navigation bar with 'BLAST® » blastn suite' and links for 'Home', 'Recent Results', 'Saved Strategies', and 'Help'. Below this is a tabbed interface with 'blastn' selected. The main section is titled 'Standard Nucleotide BLAST' and contains a large text area for 'Enter Query Sequence'. To the right of this area are fields for 'Query subrange' (From and To). Below the text area are options to 'Or, upload file' (with a 'Choose File' button and 'no file selected' text) and a 'Job Title' field. At the bottom, there's a checkbox for 'Align two or more sequences'.

- Single-cell data has been generated for nearly every human tissue type
- These datasets may be integrated to form high-quality references (“reference building”)
- Information in references may be transferred onto user queries (“reference mapping”)

Reference mapping in single-cell genomics

Unsupervised analysis

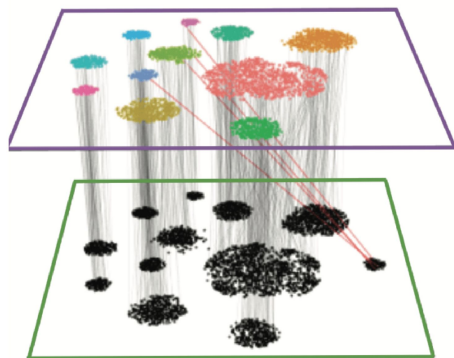

- Quality control
- Normalization and scaling
- Identification of variable genes
- Dimensional reduction (e.g., PCA)
- Data integration (multiple studies)
- Clustering
- Identification & visualization of marker genes
- Manual cell type annotation

Supervised analysis

- Rapid and fully automated
- Consistent and easily reproducible
- High-resolution cell type annotations
- Improves interpretability of low-quality data

Reference mapping in single-cell genomics

Seurat v4

Integrated analysis of multimodal single-cell data.
Yuhan Hao, Stephanie Hao [...] Peter Smibert, Rahul Satija.
bioRxiv 2020.10.12.

Symphony

Efficient and precise single-cell reference atlas mapping with Symphony. Joyce B. Kang [...] Soumya Raychaudhuri. *bioRxiv* 2020.11.18.

scArches

Query to reference single-cell integration with transfer learning. Mohammad Lotfollahi [...] Fabian J. Theis. *bioRxiv* 2020.07.16.

- Demo of **Azimuth**: online GUI for reference-based mapping

Reference mapping with Seurat v4

- (1) Query is preprocessed using same SCTransform model as reference
 B_0 (intercept), β_1 (log_UMI), Θ (dispersion), μ (mean)

Reference mapping with Seurat v4

- (1) Query is preprocessed using same SCTransform model as reference
 B_0 (intercept), β_1 (log_UMI), Θ (dispersion), μ (mean)
- (2) Dimension reduction model (e.g, PCA, SPCA) from reference is projected onto query

Reference mapping with Seurat v4

(3) For each query cell, we can assign reference cell “anchors” if they satisfy the mutual nearest neighbor condition.

4) Each query cell can also be assigned anchor “weights”, reflecting the relative importance of nearby anchors.

5) Labels from reference can be transferred to a given query cell as a weighted sum.

Reference mapping with Seurat v4

(3) For each query cell, we can assign reference cell “anchors” if they satisfy the mutual nearest neighbor condition.

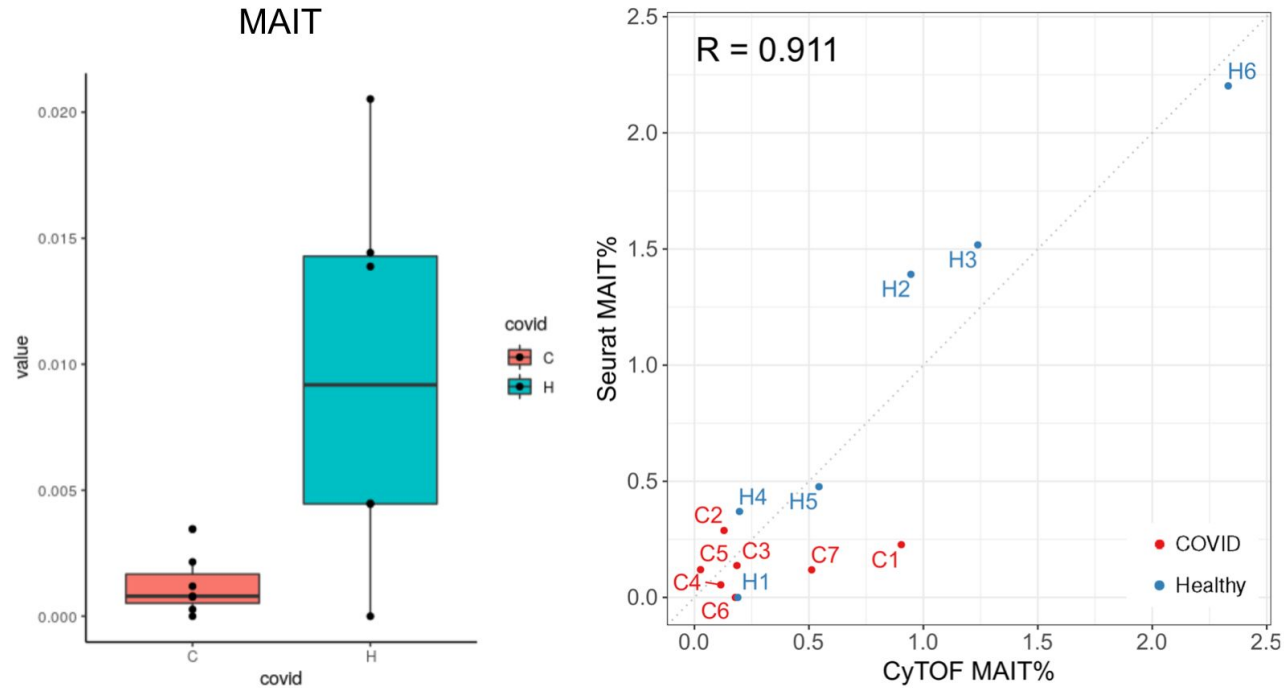

4) Each query cell can also be assigned anchor “weights”, reflecting the relative importance of nearby anchors.

5) Labels from reference can be transferred to a given query cell as a weighted sum.

Reference mapping with Symphony

- (1) Query is preprocessed using same variable features and scaling parameters as reference
 μ (mean), σ (standard deviation)
- (2) Dimension reduction model (PCA) from reference is projected onto query
- (3) Cells “soft-assigned” to reference clusters
- (4) Query batch effects per cluster are modelled.
- (5) Query data is batch corrected.
- (6) Labels are transferred from reference to query using consensus of 5 nearest neighbors

Reference mapping with Symphony

- Symphony as a 2-step anchoring procedure

Symphony

Query scaled by reference means and standard deviations

Reference PCA model is projected onto query

Query cells are “soft-assigned” to reference clusters
--> Query cells batch-corrected
--> Query cells anchored to 5 NN

Seurat

Query preprocessed with reference SCTransform model

Reference PCA model is projected onto query

Query cells get “weighted anchors” to reference cells
